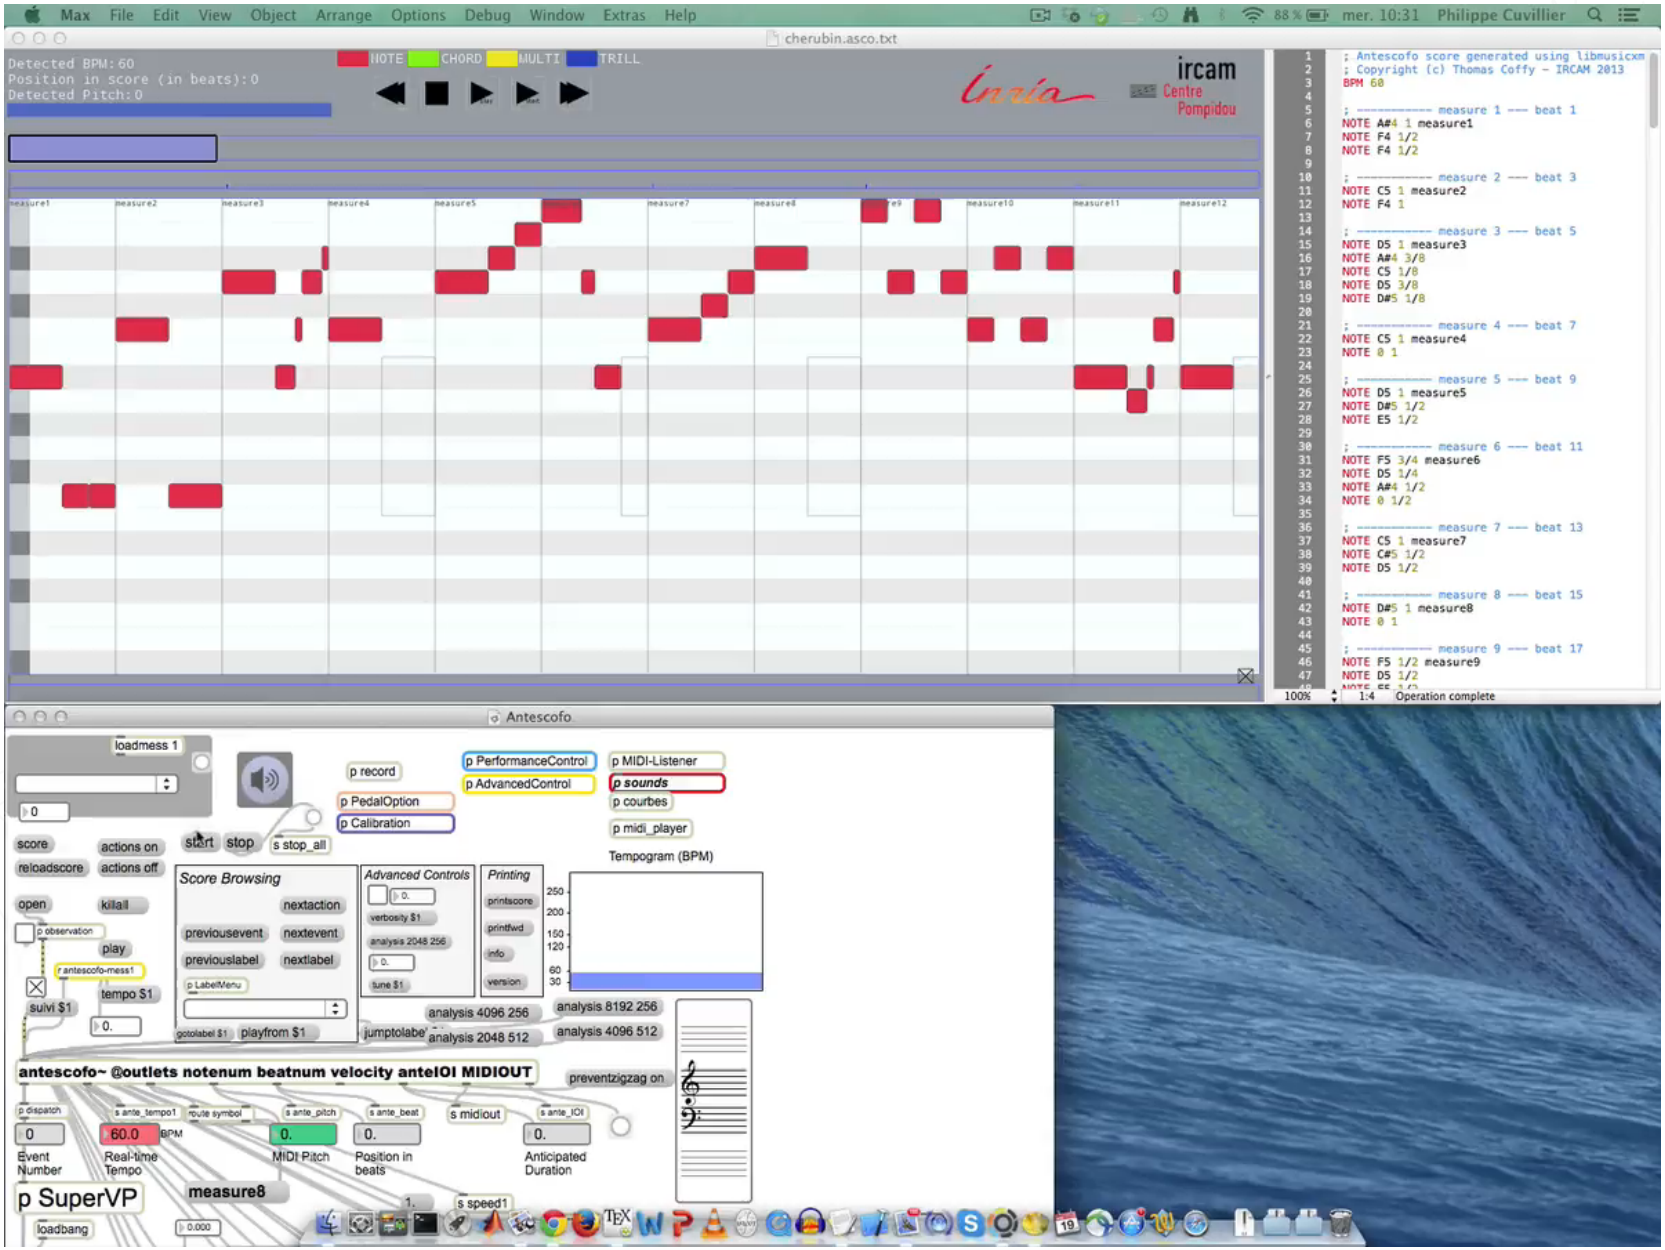
Dealing with wide ranges of interpretation and errors



Tesla ou l'effet d'étrangeté Julia Blondeau (2014)

alto: Christophe Desjardins, real-time electronic: Antescofo

ODEI (performance Les Nuits Sonores, Lyon, 2014)

Outlines

Interactive Music Systems as interpreters (computer meaning of « interpretation »)

- time in a score
- score as program, performance as execution !?
- the interpretation problem

Times in Antescofo

- time in computer programing languages
- events and duration
- from triggers to synchronization strategy
- time-time diagrams
- tempo extraction
- temporal scope
- some metaphysical questions
  - why multiple times ?
  - fungible or incomparable times ?
  - time and causality ?

Some other artistic applications

- the Polyrhytmic Machine
- Marco Stroppa's Totem
- open score by Jason Freeman
- gesture-following by José-Miguel Fernandez

Final remarks

- from functions to interactions through processes
- sharing our time with machines

- temps discret et temps continu
- un temps construit à plusieurs
- une notation géométrique du temps
  = le hors-temps de la partition

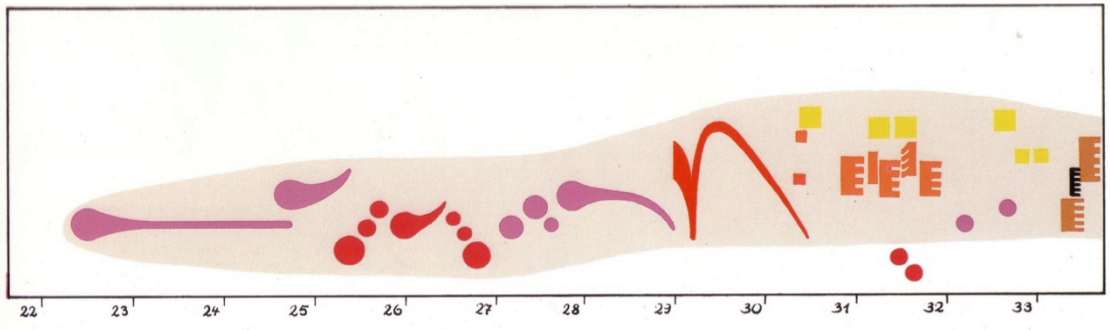
QUEL TEMPS DANS UNE PARTITION ?

A Score

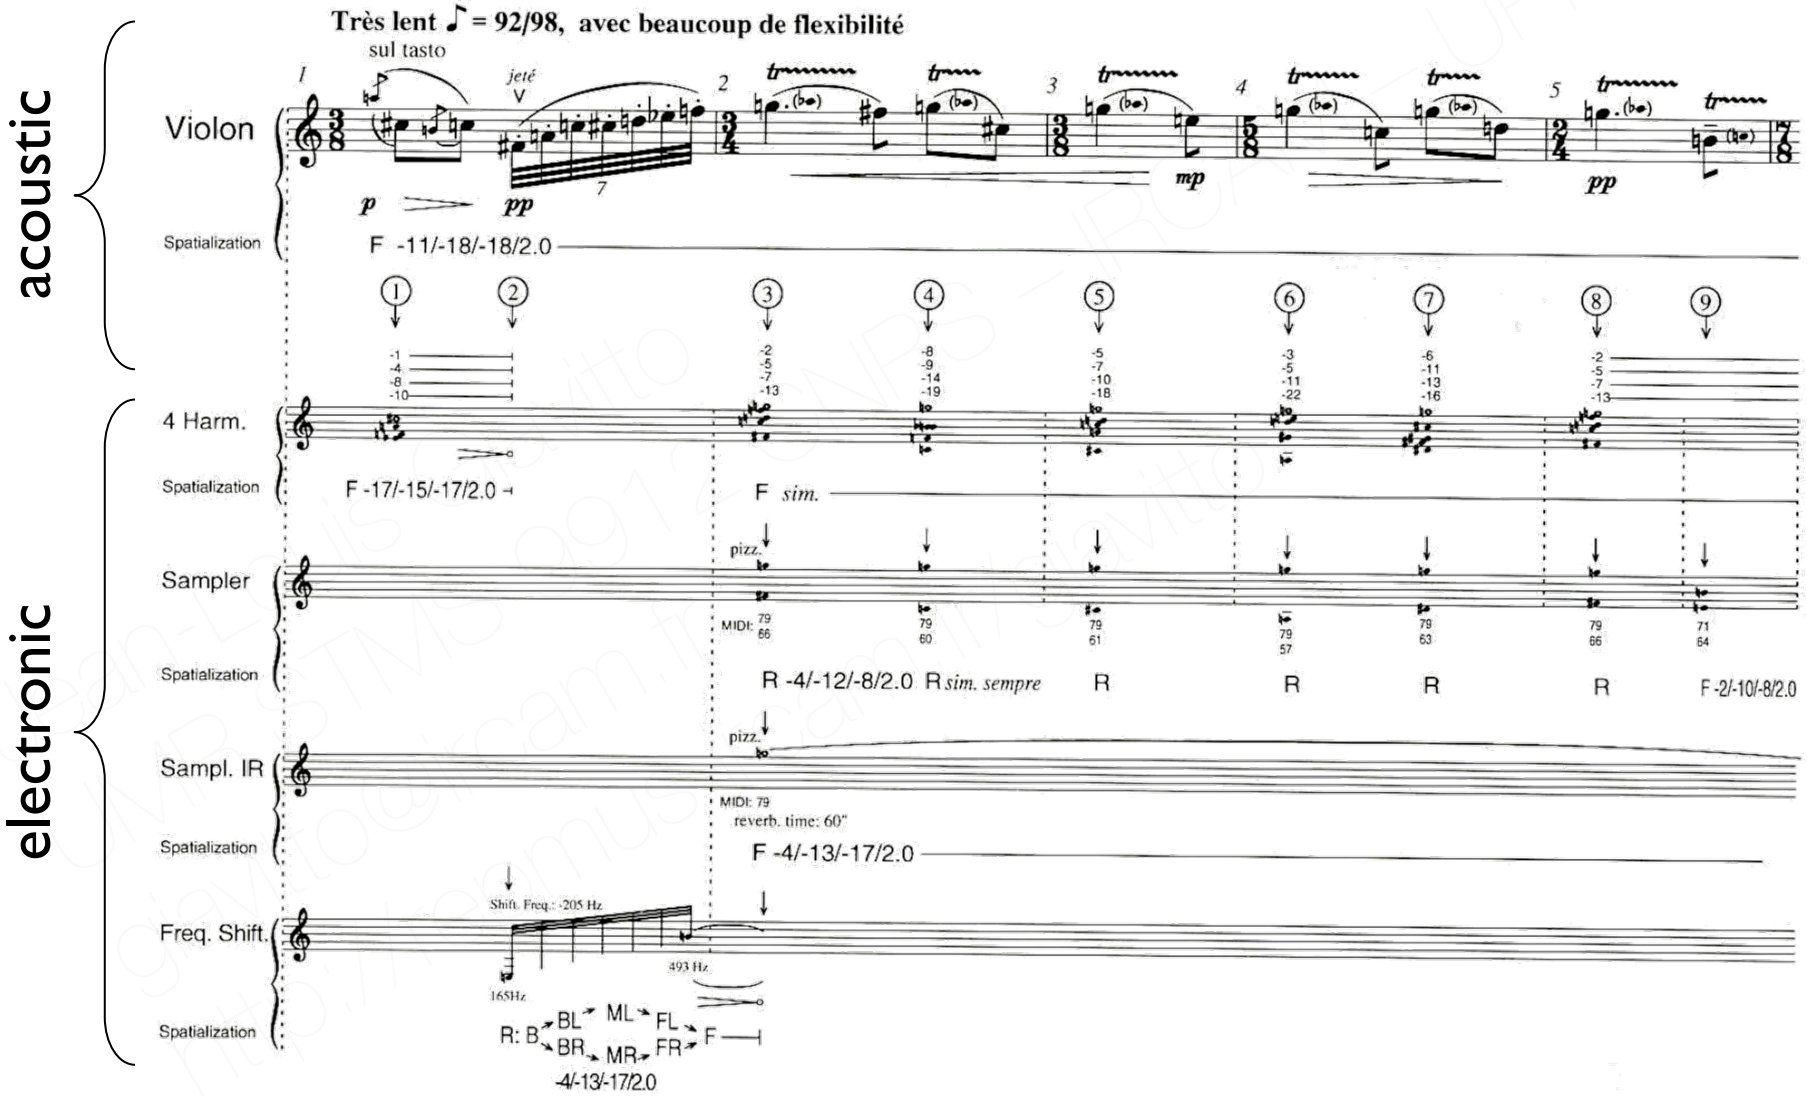
- instantaneous events
  (e.g. the onset of a note)

- events that last
  (duration of a note)

- continuous change of parameter (*movement*, *gesture*)
  - frequency
  - ambitus
  - sound localization
  - etc.

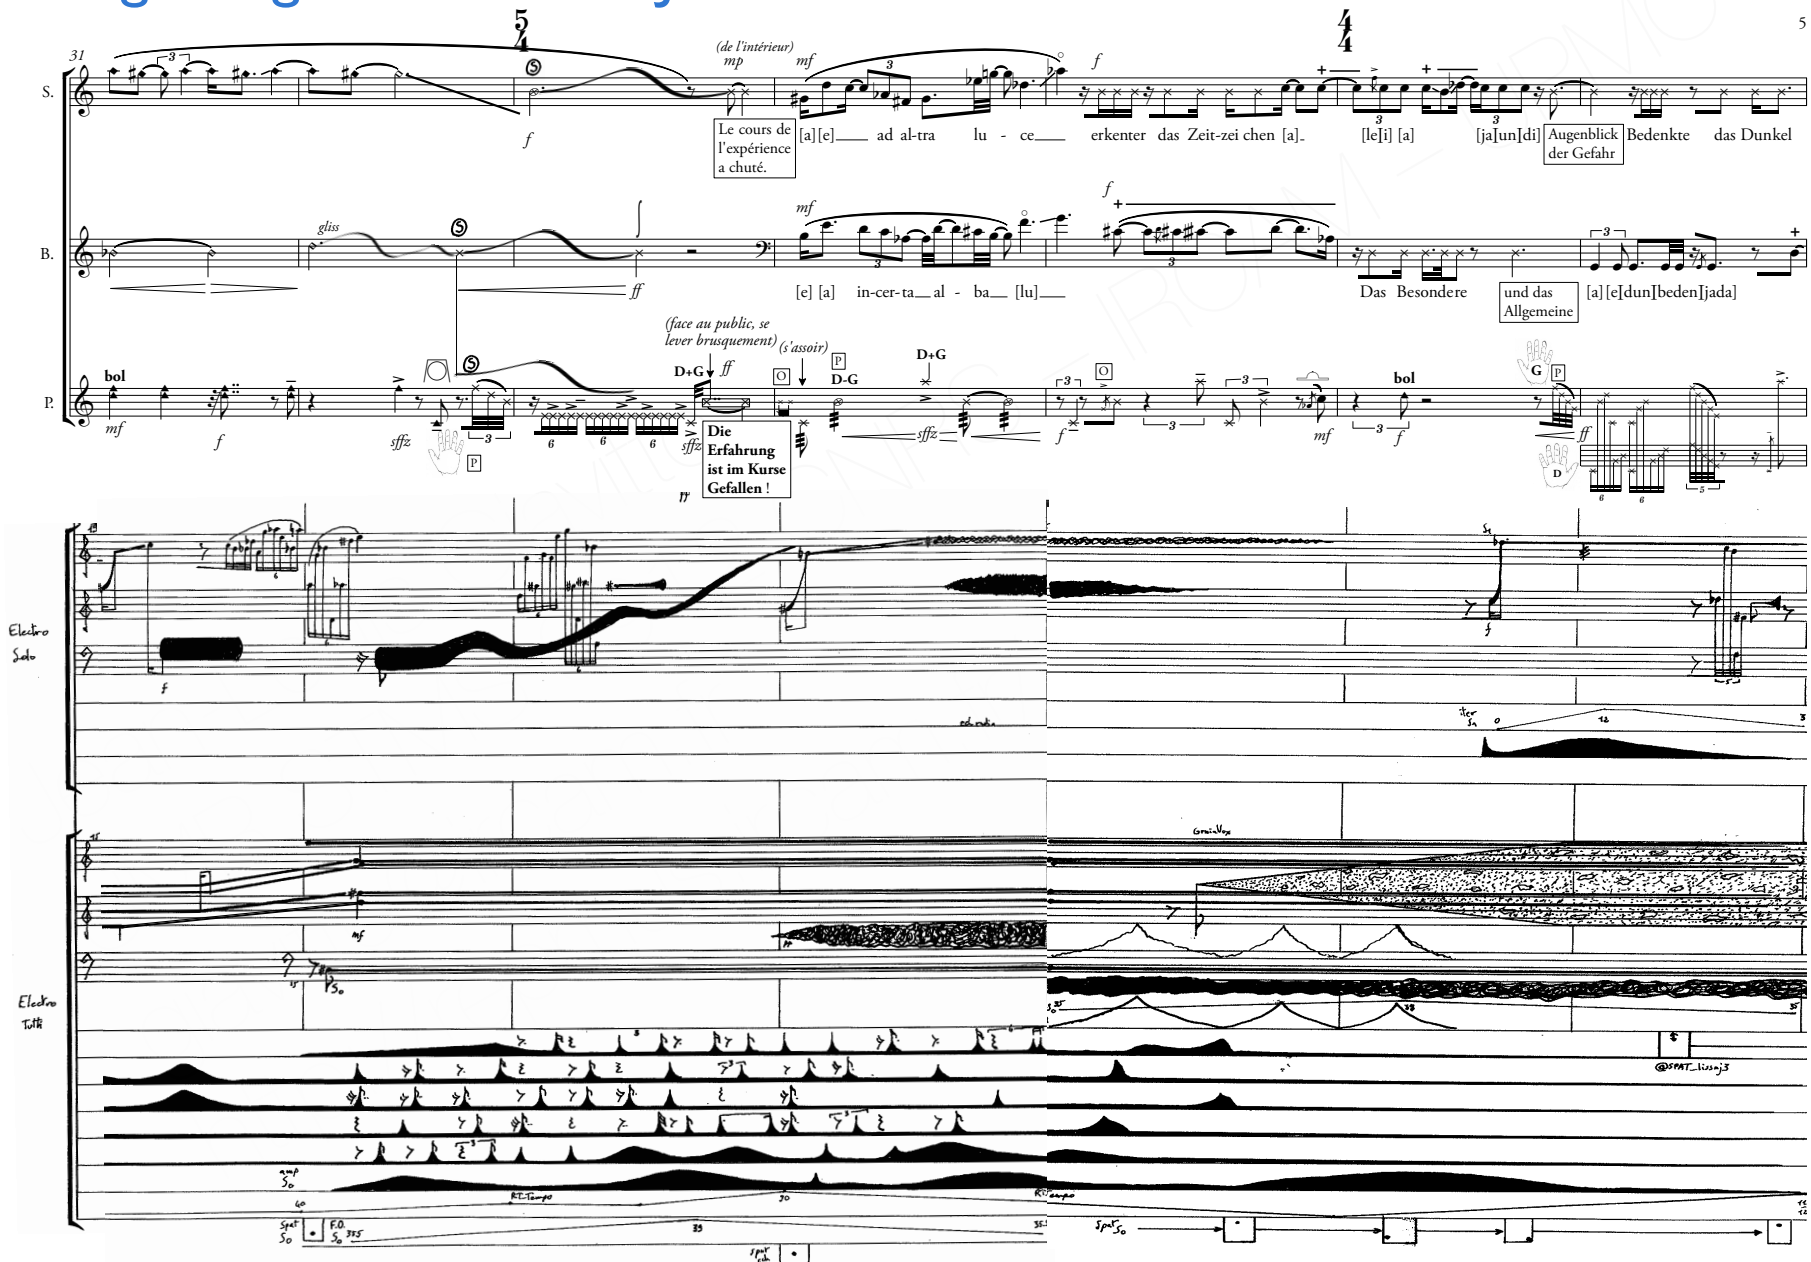


Beginning of Antheme2 score (P. Boulez)



Notice the difference with…

beginning of *Nachleben Julia Blondeau*



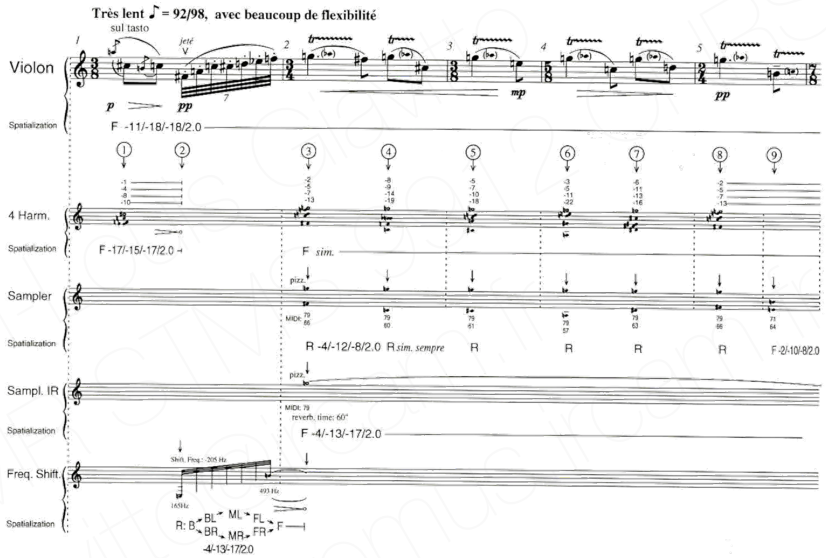
Notice the difference…

from trigger (event alignment)

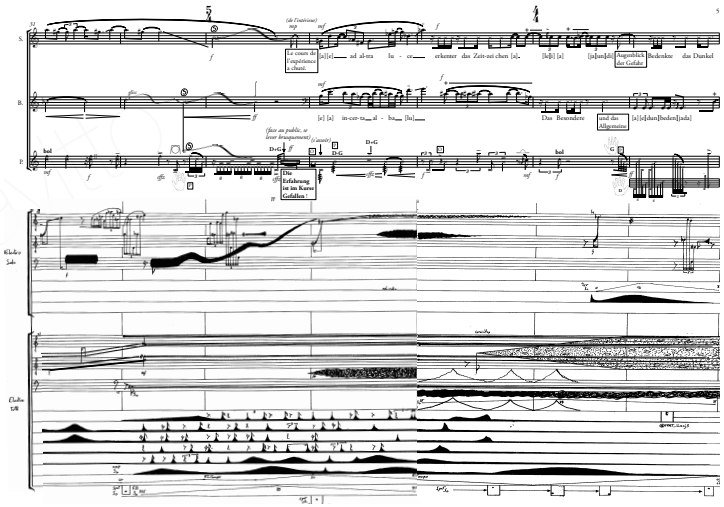
to synchronization (full timeline event + duration alignment)

electronic acoustic

Antheme2
Pierre Boulez



Nachleben
Julia Blondeau



An augmented score in *Ascograph*

(Thomas Coffy, Grieg Burloiu)

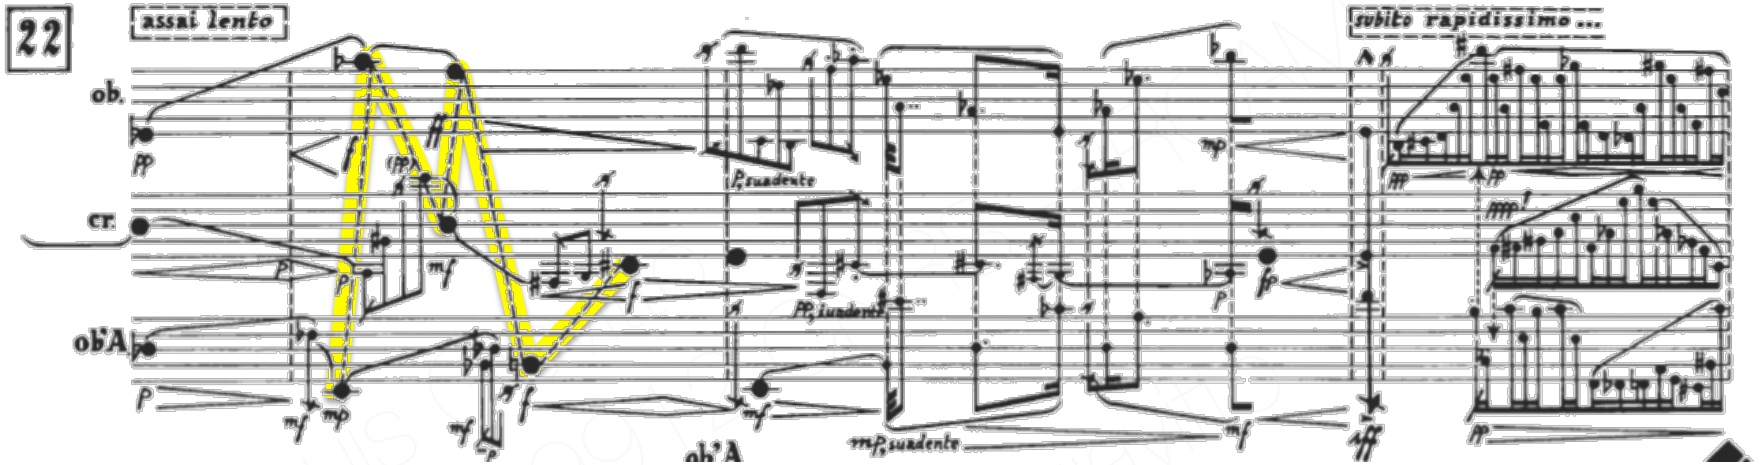
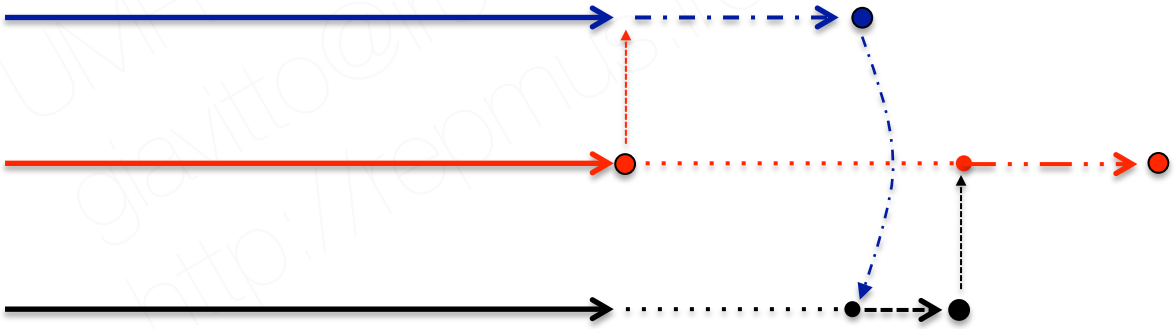
Un temps construit à plusieurs (de manière distribuée)



Stockhausen, *Gruppen*



waiting an event

waiting a duration

Le “hors temps” de la partition

Quand le compositeur organise du temps dans une partition :

- le temps qui s’écoule pour lui n’est pas celui qu’il note
- le temps noté est un temps « spatialisé »: tous les instants sont accessibles et ont le même statut

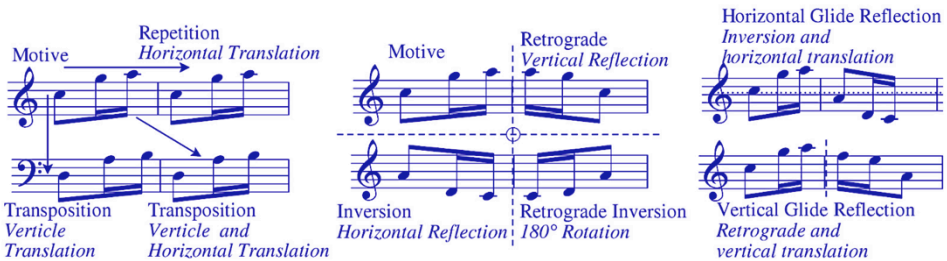


Figure 1: *All Eight Isometric Transformations in Musical Space*

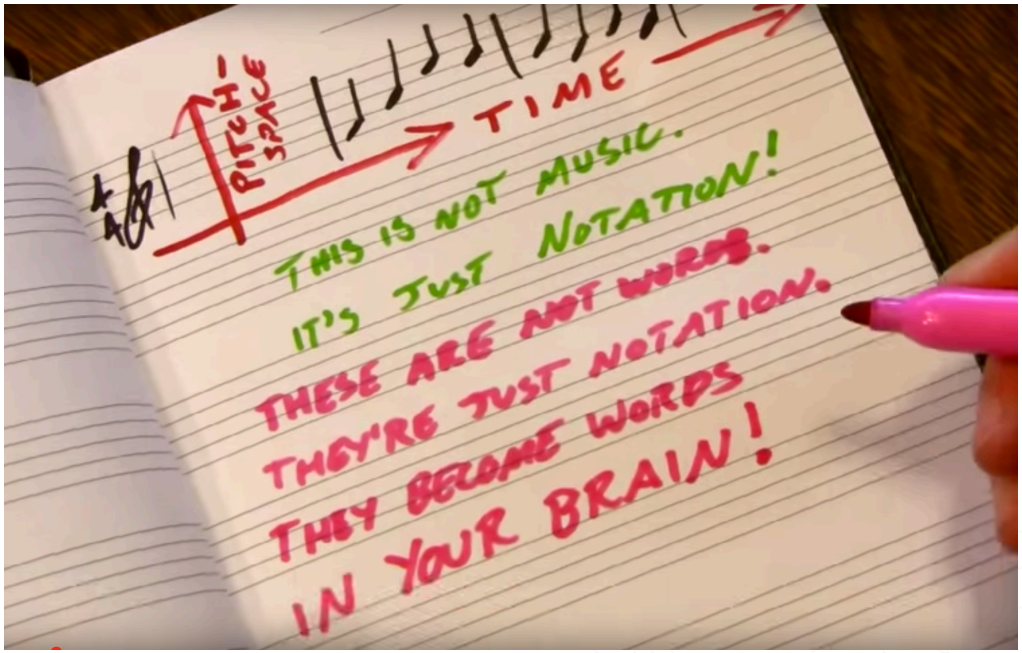

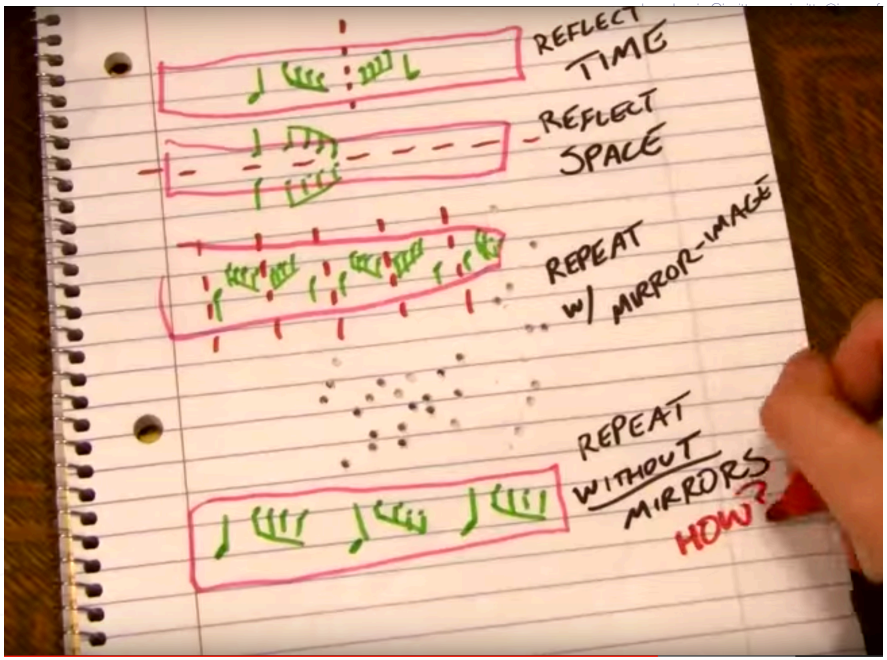

Vi Hart

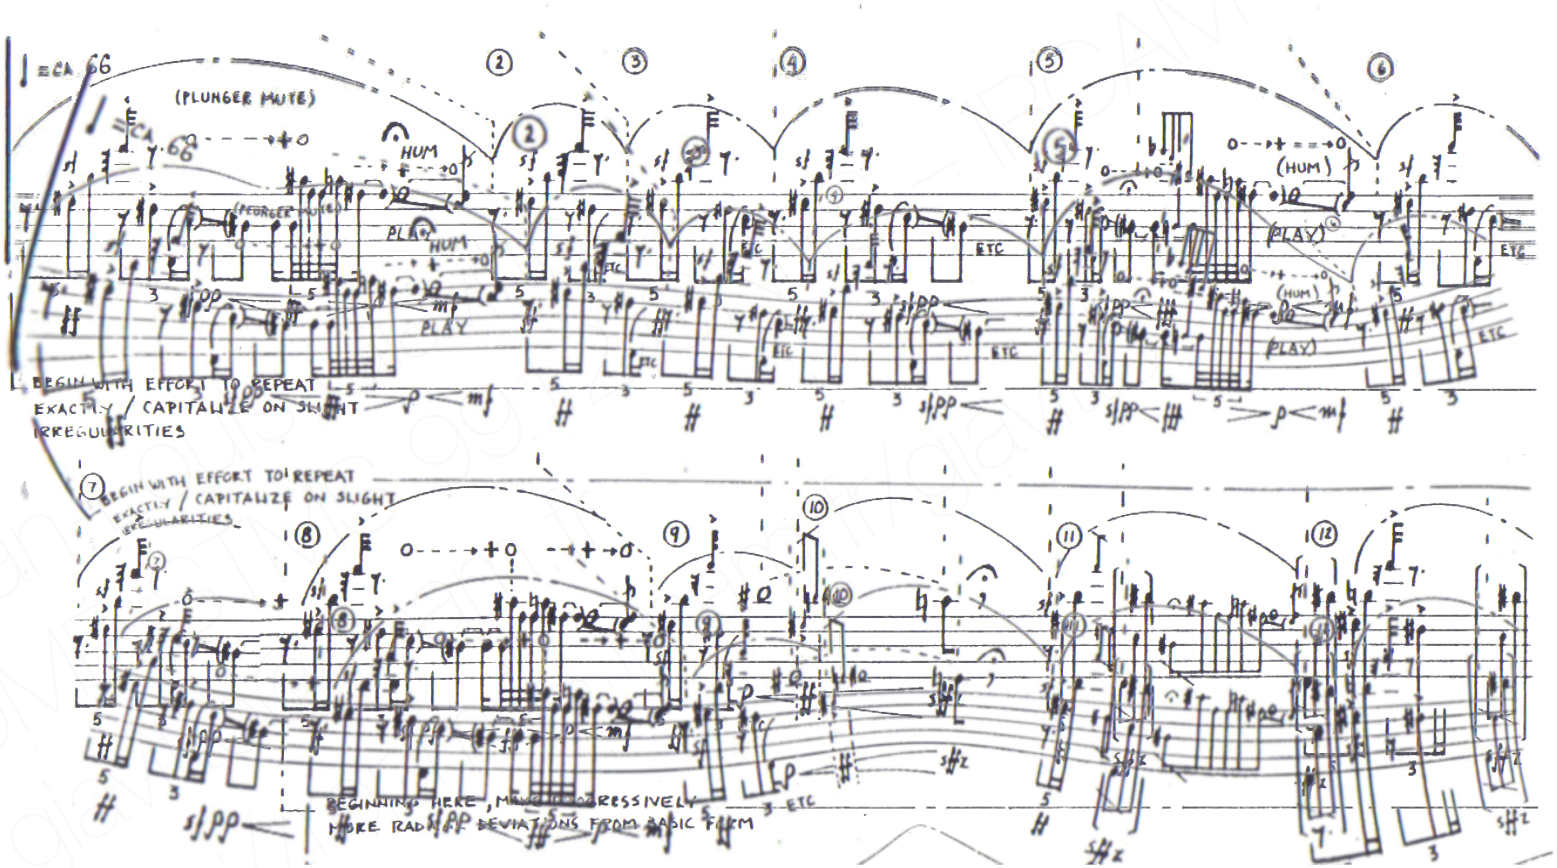
Musicans
(& audience)

authoring interaction :
- performance
- computing *in* real-time

The Antescofo aproach (to mixed music)

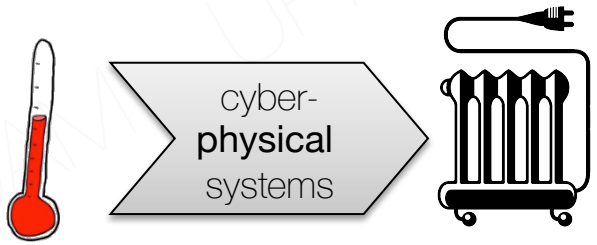
- An *augmented score* is a real-time program
  - the composer is a programmer that specifies bith human and electronic parts
  - program evaluation is done jointly by <musician | machine>
  - the composer specifies the synchronization between human and electronic parts
- The listening machine provides the inputs to the machine
  <musician | *listening & recognition* | strongly timed program>
- **BUT music interpretation is not program evaluation**
  the gap between the score and its implementation is intentional
- **Time is a first class entity in the DSL**
  - time is not an operational property (e.g., a quality of service or a performance metric)
  - handling of events and duration
  - chronometric and relational time
  - computing dynamic timelines

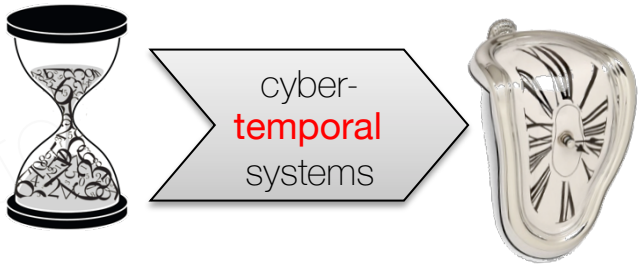
La déformation de la partition à l'interprétation



Cyber-temporal systems: computing time in real-time

- *from:* physical entities monitored by algorithms
- *to:* temporal relationships sensed and organized by algorithms
- *example:* interactive music systems
  Antescofo





- notionS of TIME:
  - multiple times: deferred time, real-time
  - multiple models of time: event-driven, time-driven
  - multiple scales: from audio (0.02 ms) to control (hours)
  - time programmability: time is a denotable entity

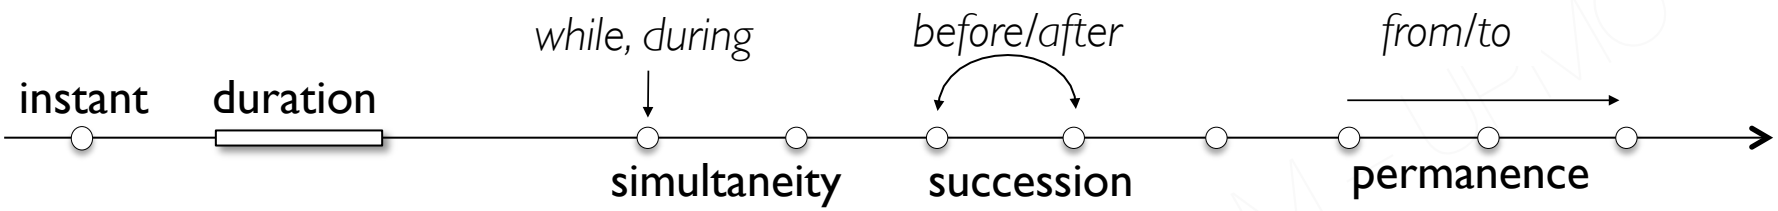
Times in Antescofo

- multiple time(s)
- tempo extraction
- from triggers to synchronization
- the interpretation problem
- time-time diagrams

times in Antescofo

MULTIPLE TIMES

Instant and Duration: Simultaneity, Succession & Permanence



process algebra

non-simultaneity

non-permanence

succession

synchronous languages

non-permanence

simultaneity

non-succession

temporized systems

non-simultaneity

its not simultaneous to something

and

its not before nor after

➔ so, its lasts

permanence

non-succession

Can we deal with *instants* only?

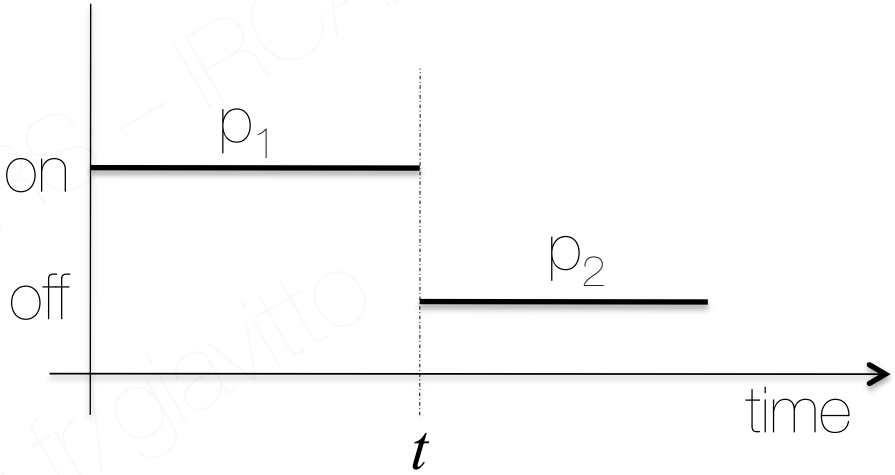
➔ duration as a set of contiguous instants

- evenemential-time

versus

- the fluxion: continuous passage of time
  - going twice faster
  - finishing together
  - accelerando
  - rubato
  - tempo
  - etc…

Can duration be reduced to instant? (in temporal logic)



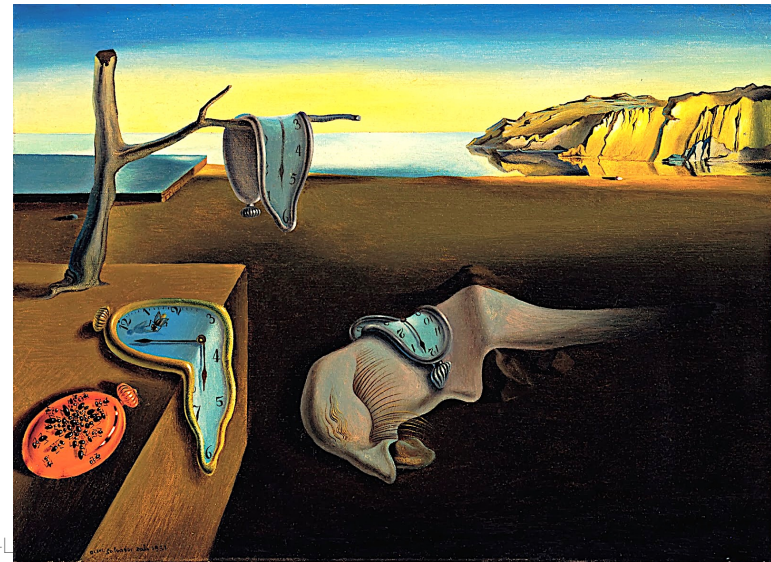
doing real analysis and topology

or

making instant and duration primitive notions

Du temps unique aux temps multiples

- temps unique : *une horloge externe objective*
  - les événements arrivent *dans* le temps
  - temps newtonien, unités temporelles fongibles
  - un temps partagé prescriptif
    (qui n'est éventuellement que partiellement connu)
- temps multiples : *pluralités co-dépendantes*
  - les événements définissent le temps
    (Bluedorn: epochal time is defined by events)
  - Temps leibnizien, relationnel
  - Exemples :
    - partition : couches temporelles
    - relation partition / performance
    - co-construction lors de la performance



Example of relational (event-specified) time
Roman notions of summer hours and winter hours

times in Antescofo

TEMPORAL SCOPES = EVENT + TEMPO

Temporal objects and relationships handled in Antescofo

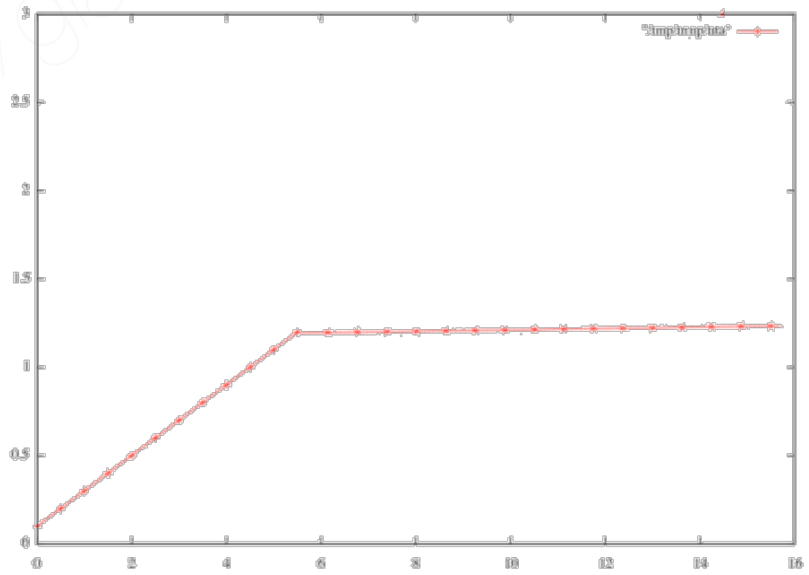
- Instant
  synchrony hypothesis = atomic computations are instantaneous
- Duration
  delay, period, sample
- Different ways of denoting time
  - event/ chronometric
  - absolute / relative
  - continuous / discrete
  - control / audio
- Various scales
  - audio (1/44 ms)
  - control (2 ms -> 1 h)
  - human perception of sound simultaneity ~ 20ms

Temporal Scope

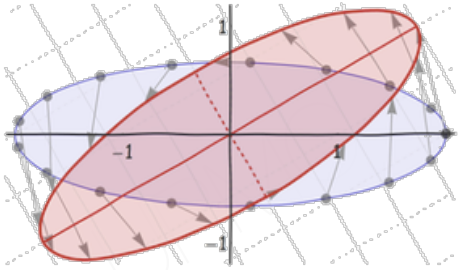
- each sequence of actions has a temporal scope
- a temporal scope defines *how time passes* with respect to another temporal scope (synchronization)
- the passing of time may takes into account
  - the occurrence of events
  - the tempo of the followed temporal scope (how time passes between events)
  - what to do if the two information disagree
- primitive temporal scopes
  - the musician
  - the physical time (no event, except the beginning of time)
  - any process using tempovar to specify events and tempo

Strongly timed

- **event-driven: reacting to events**
  - events from the listening machine
  - logical events
    - predicates on variables
    - begining or end of a computation (continuation)
  - introspective events
- **time-driven: managing durations**
  - delay
  - continuous actions
  - relative time (dynamic) tempo
  - synchronization: tempo + event
- **time-controled concurrency**
  - all actions are *in parallel*
  - **no** lock/mutex/threads…

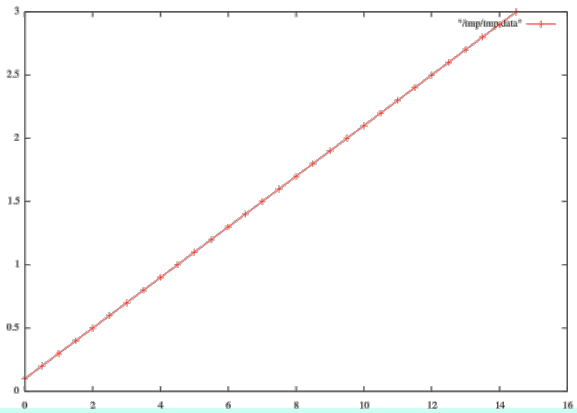


Strongly timed



- time transformations are for *Antescofo* what changes of coordinates are for postscript…
- **BUT**
  - time is only spent in real-time
  - time is evenmential and durative
  - time is causal
    (I don't know the transformation in the future)
  - the transformation comes from the environment
    (synchronization)
  - transformations are not necessarily *newtonian*
    (when human is in-the-loop position ≠ ∫ tempo)

Tempo inheritance



```
@proc_def ::Trace()  {
        @local $x
        $x := 0
        Loop L 0.1 {
                $x := $x + 0.1
                plot $NOW " " $x "\n"
        }
}
$trace1 := ::Trace()

Dynamic Target

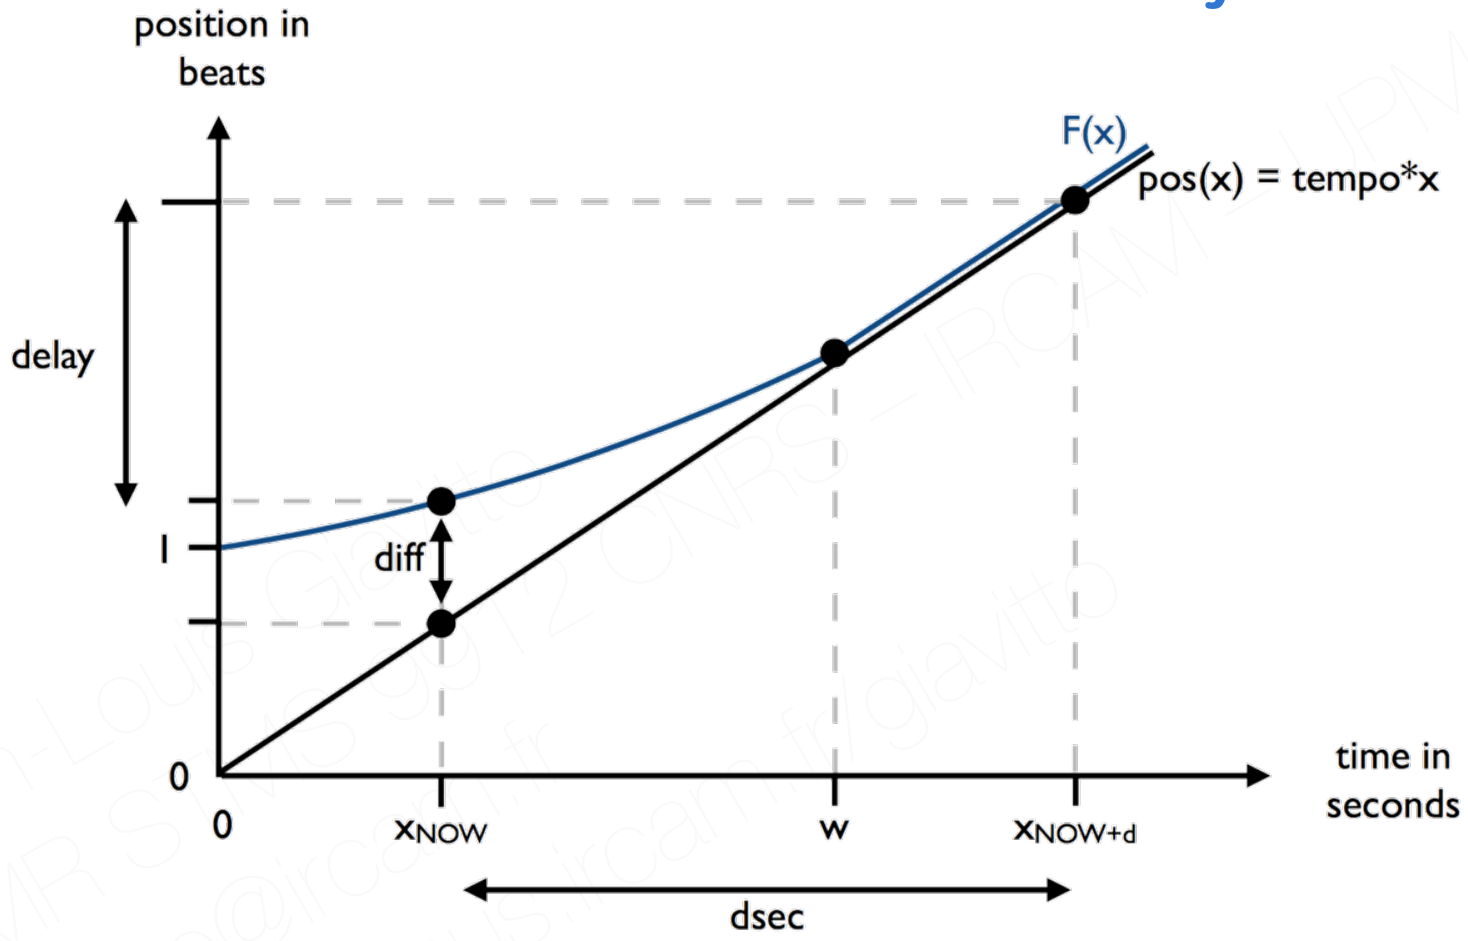

Fig. 10. Method used to compute a duration $dsec$ in seconds corresponding to a delay $delay$ in beats with a dynamic target $[w]$ and with a initial difference of position $diff = \tau.beatPos - position$. Function F represents the position in τ as a function of time x. It is made of two parts: a part G where the $\tau.tempo$ changes linearly until it becomes equal to $tempo$. From this time, F evolve as pos, with $\tau.tempo = tempo$ (a constant). Function G is the part of the parabola that goes from $x = 0$ to $x = w$. Because the origin is translated w.r.t. the origin of the physical time, the date x_{NOW} of the current instant is localized on the X axis by looking at the point which achieve the current difference $diff$.

FUNGIBLE TIMES
OR
INCOMPARABLE TIMES ?

One second per second

€ $

Subordination of the objective time to the subjective ones and *not the reverse*!

- shared events are not enough:
  duration is not reducible to instants
  - halving a duration
  - accelerando
  - *phrasé* (ex. rubato)
- the "conversion rate" changes in time and is known "after". The conversion rate is *established with the weaving of time itself*.
  - A-series et B-series,
  - "out of time" ("deferred time") of the composition *versus* the real-time of the performance
- Subjective time is useful: the score refers to this subjective time, not to physical time in second
- *In fine*, it enables a effective musical interaction between the performer and the computer

PASSAGE DU TEMPS ET CAUSALITÉ

The passing of time: causality & duration

Jason Freeman (GeorgiaTech)

Shadows, 2015 dynamic non-deterministic score

(*excerpt from the score, Jason Freeman*)

The computer tracks the choices you make about which fragments to play and how long you play each one. It always highlights the fragment you are currently playing in blue and draws thick black lines to the fragment(s) you can choose to play next.

During your performance, the computer will vary how many choices it gives you about what to play next, as well as how it determines your options. It bases these decisions on which fragments you have played recently and for how long you have played each. At some points in the performance, the computer will push you towards repeating and alternating between the fragments you have played most often. At other points, it will push you to play fragments you have not played recently. Some aspects of the computer's algorithm, such as how many choices to give you and when to change sections, are updated automatically at predetermined times during your performance.

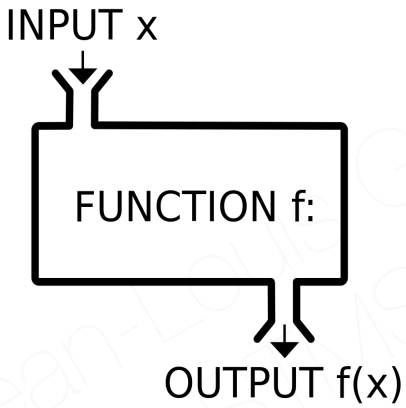
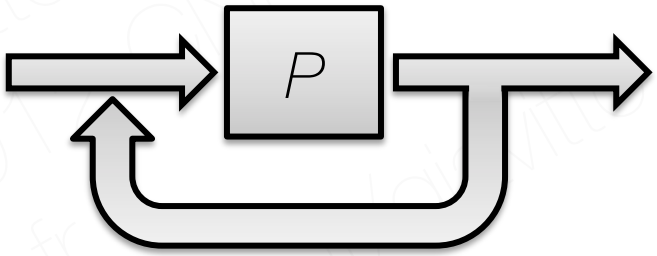
FINAL REMARKS

Computation:
function, process, *interaction*





All Watched Over By Machines of Loving Grace

by Richard Brautigan

I like to think (and
the sooner the better!)
of a cybernetic meadow
where mammals and computers
live together in mutually
programming harmony
like pure water
touching clear sky.

I like to think
(right now, please!)
of a cybernetic forest
filled with pines and electronics
where deer stroll peacefully
past computors
as if they were flowers
with spinning blossoms.

I like to think
(it has to be!)
of a cybernetic ecology
where we are free of our labors
and joined back to nature,
returned to our mammal
brothers and sisters,
and all watched over
by machines of loving grace.
