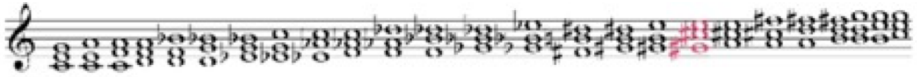
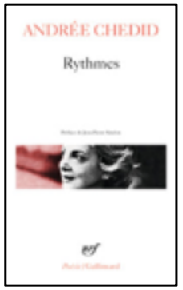
Gilles Baroin



From poetry to song writing: hamiltonian compositional strategies



A part (Andrée Chedid, poème tiré du recueil *Rhymes* Collection Poésie/Gallimard (n. 527), Gallimard, 2018)

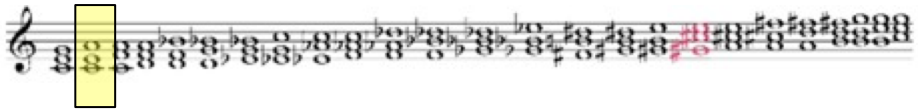
➔ http://repmus.ircam.fr/_media/moreno/prix_chedid_2018_moreno.mp3

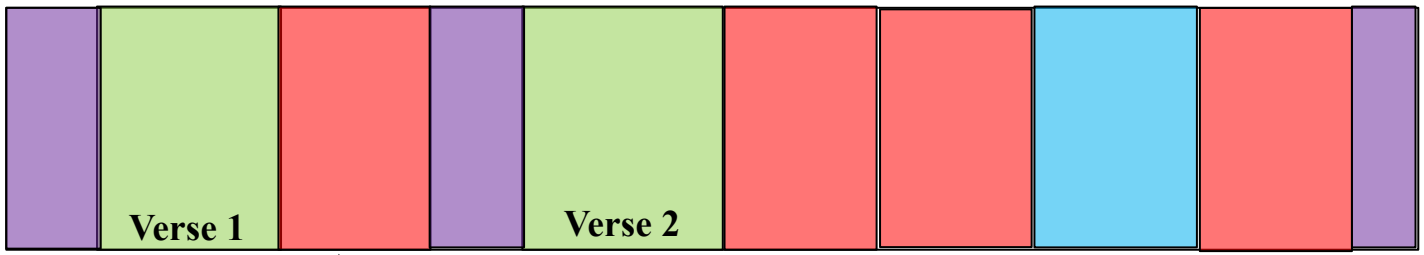
À part le temps
Et ses rouages
À part la terre
En éruptions
À part le ciel
Pétrisseur de nuages
À part l'ennemi
Qui génère l'ennemi

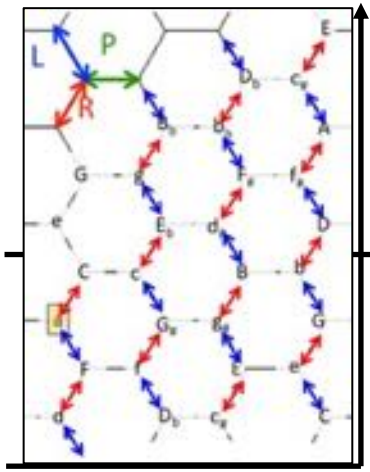
À part le désamour
Qui ronge l'illusion
À part la durée
Qui moisit nos visages

À part les fléaux
À part la tyrannie
À part l'ombre et le crime
Nos batailles nos outrages

Je te célèbre ô Vie
Entre cavités et songes
Intervalle convoité
Entre le vide et le rien







Less trivial Hamiltonian Cycles

La sera non è più la tua canzone
(Mario Luzi, 1945, in *Poesie sparse*)

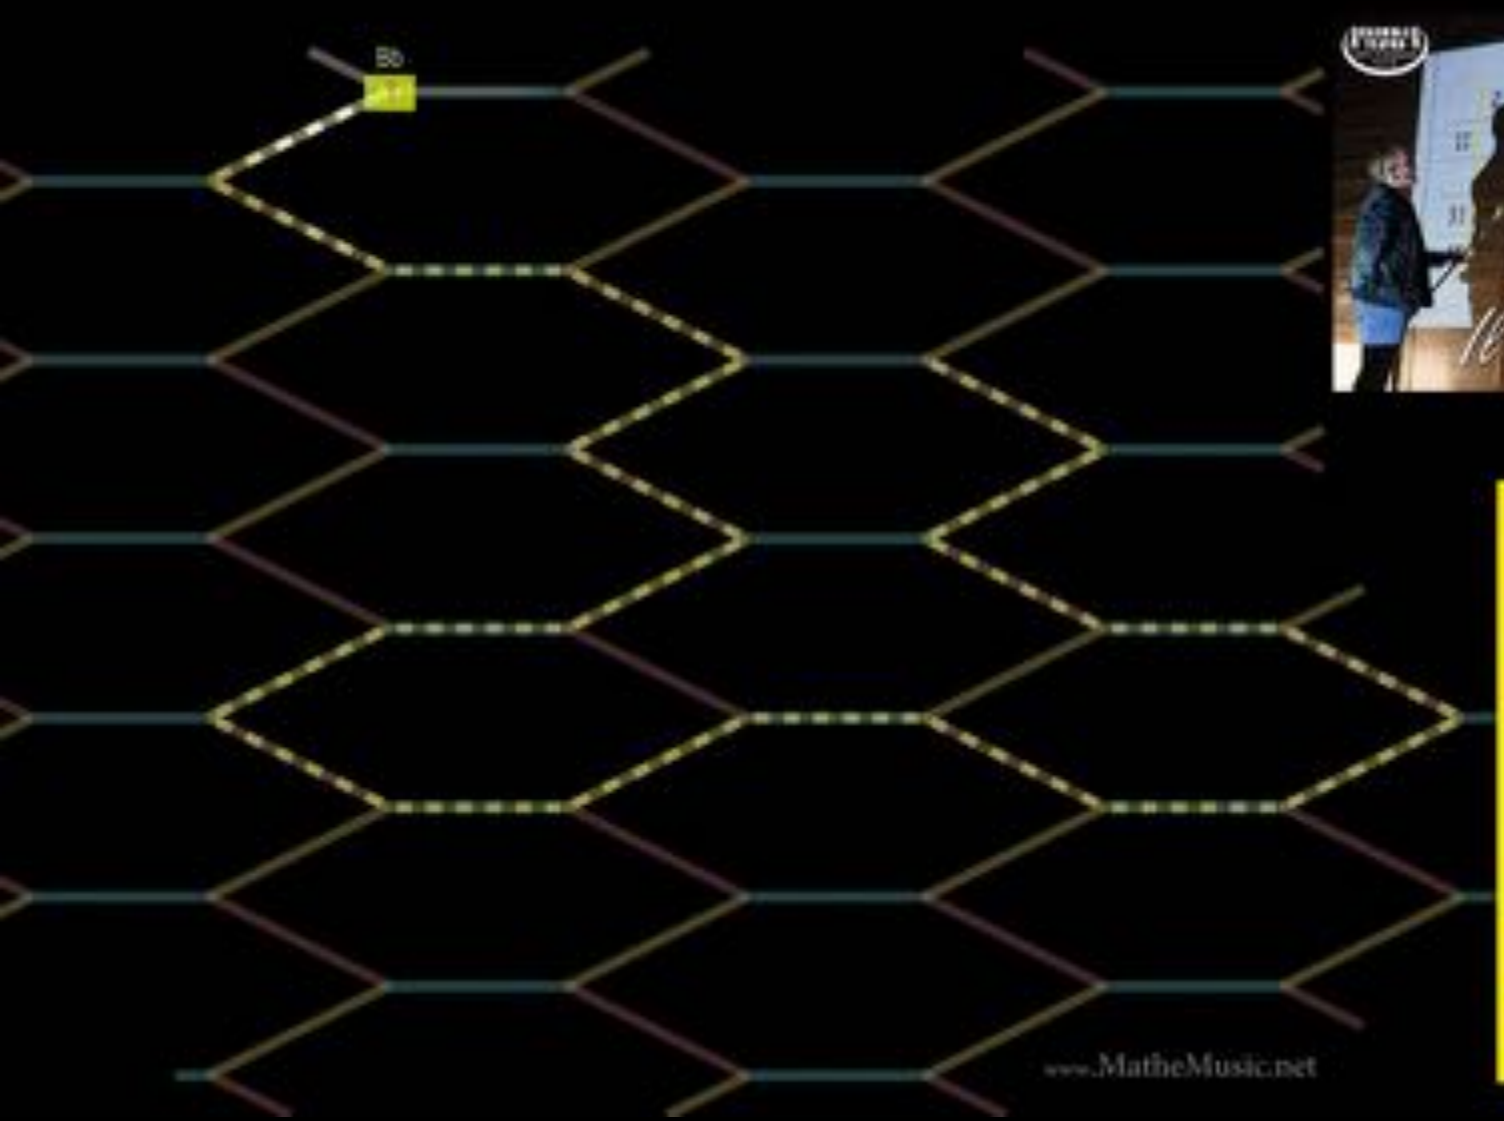
La sera non è più la tua canzone,
è questa roccia d'ombra traforata
dai lumi e dalle voci senza fine,
la quiete d'una cosa già pensata.

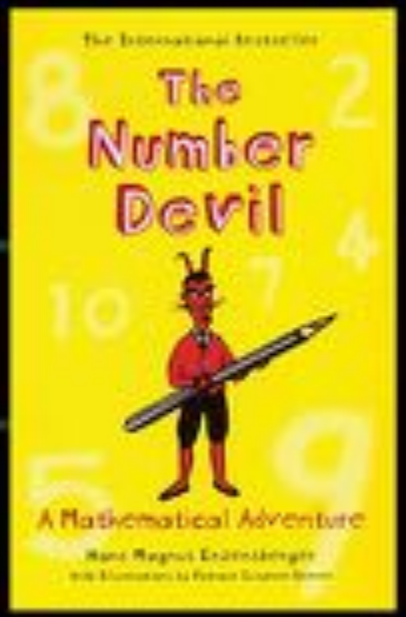
Ah questa luce viva e chiara viene
solo da te, sei tu così vicina
al vero d'una cosa conosciuta,
per nome hai una parola ch'è passata
nell'intimo del cuore e s'è perduta.

Caduto è più che un segno della vita,
riposi, dal viaggio sei tornata
dentro di te, sei scesa in questa pura
sostanza così tua, così romita
nel silenzio dell'essere, (compiuta).

L'aria tace ed il tempo dietro a te
si leva come un'arida montagna
dove vaga il tuo spirito e si perde,
un vento raro scivola e ristagna.

Hamiltonian Cycles of maximal complexity





The same cycles have been used in the song *Aprile* (after a poem by Gabriele D'Annunzio):

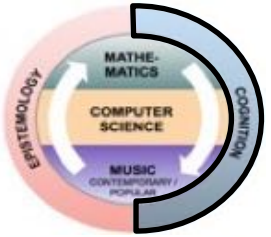
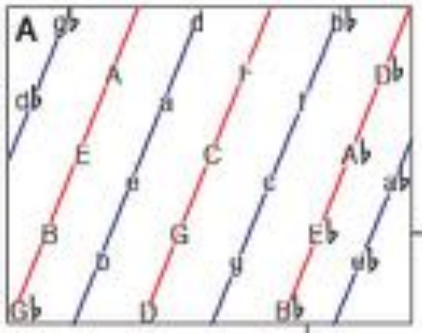
Neo-riemannian analysis and perception

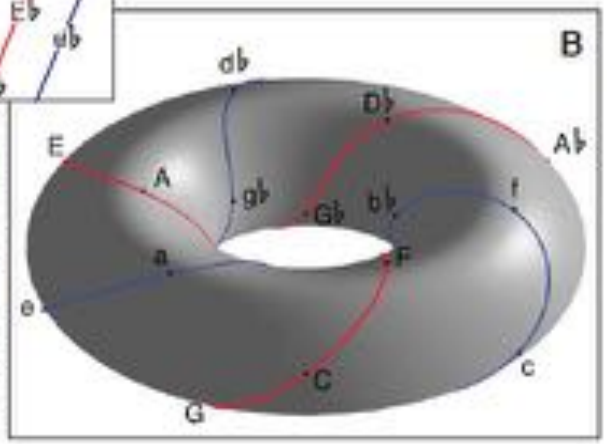




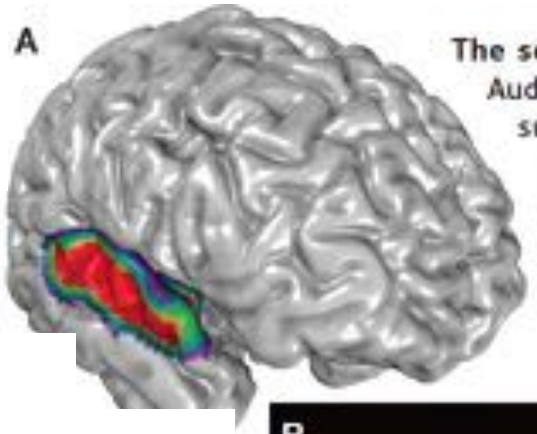
PERSPECTIVES: NEUROSCIENCE

Mental Models and Musical Minds

(Zatorre et Krumhansl, 2002)



Mental key maps. (A) Unfolded version of the key map, with opposite edges to be considered matched. There is one circle of fifths for major keys (red) and one for minor keys (blue), each wrapping the torus three times. In this way, every major key is flanked by its relative minor on one side (for example, C major and a minor) and its parallel minor on the other (for example, C major and c minor). **(B)** Musical keys as points on the surface of a torus.



The sensation of music. (A) Auditory cortical areas in the superior temporal gyrus that respond to musical stimuli. Regions that are most strongly activated are shown in red. **(B)** Metabolic activity in the ventromedial region of the frontal lobe increases as a tonal stimulus becomes more consonant.

(Krumhansl et Kessler, 1982)

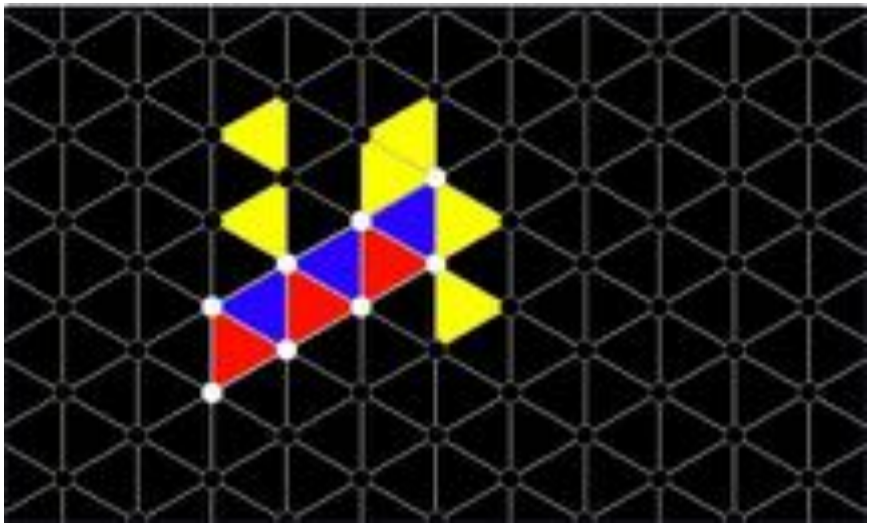
Multimodal interaction and perceptual processes

LaLaLab Exhibition, Heidelberg May 2019 – Dec 2020



Research hypotheses

- Despite the apparent geometrical simplicity of the *Tonnetz*, its deep structural implications are very complex. Only people with high skills in music theory are able, at least, to partially grasp its overall structure at first sight.

- The geometry of the *Tonnetz* is not consistent with the widely spread vertical schema for pitches; nor does it provide self-evident patterned representations of tonal functionality. Both facts may bias the apprehension of the *Tonnetz*, particularly in non-functional harmonic contexts.

Method:
Participants

88 participants (44.32% female, 55.68% male) took part in the study, split into 4 balanced groups:

1) Music professionals [MusPro] (age: M=38.32, SD=8.07)

2) Science professionals [SciPro] (age: M=43.68, SD=12.10)

3) Music students [MusStu] (age: M=22.82, SD=2.89)

4) Science students [SciStu] (age: M=20.31, SD=1.77)

Accuracy:

MusPro was significantly different ($p < .050$) for both attempts when compared with both Sci groups

Results

	Quality		Visual bias	
Group	Attempt 1	Attempt 2	Attempt 1	Attempt 2
MusPro	7.05 ± 1.79	8.32 ± 2.44	4.68 ± 2.88	3.77 ± 1.54
SciPro	5.91 ± 1.15	6.68 ± 1.21	6.55 ± 3.63	5.82 ± 3.70
MusStu	6.18 ± 1.50	7.45 ± 2.42	4.00 ± 3.51	4.00 ± 2.09
SciStu	6.41 ± 1.53	6.32 ± 1.25	4.50 ± 3.07	4.00 ± 2.02
Mus	6.61 ± 1.69	7.89 ± 2.44	4.34 ± 3.19	3.89 ± 1.82
Sci	6.16 ± 1.36	6.50 ± 1.23	5.52 ± 3.48	4.91 ± 3.09

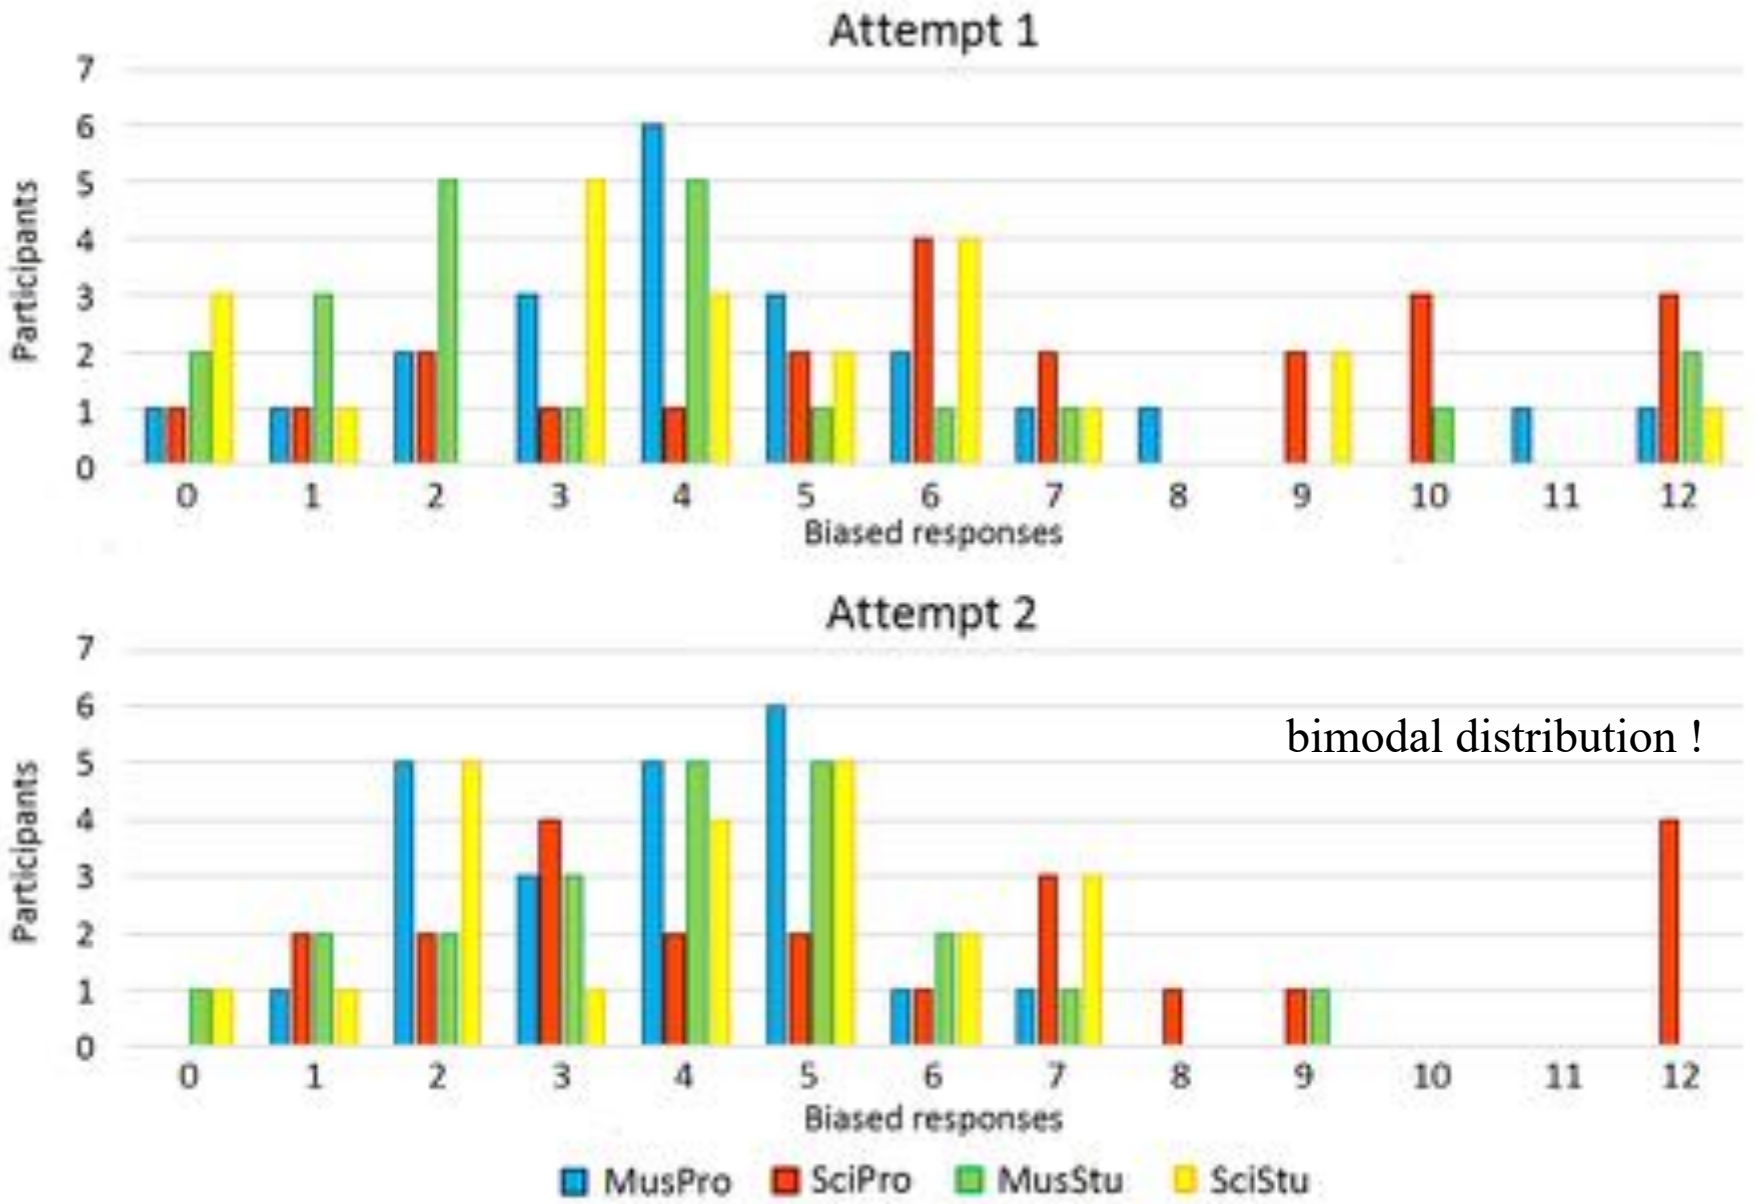
Quality:

MusPro was significantly different for both attempts when compared with both Sci groups
The difference between both attempts per group was slightly significant (except SciStu)

Visual bias:

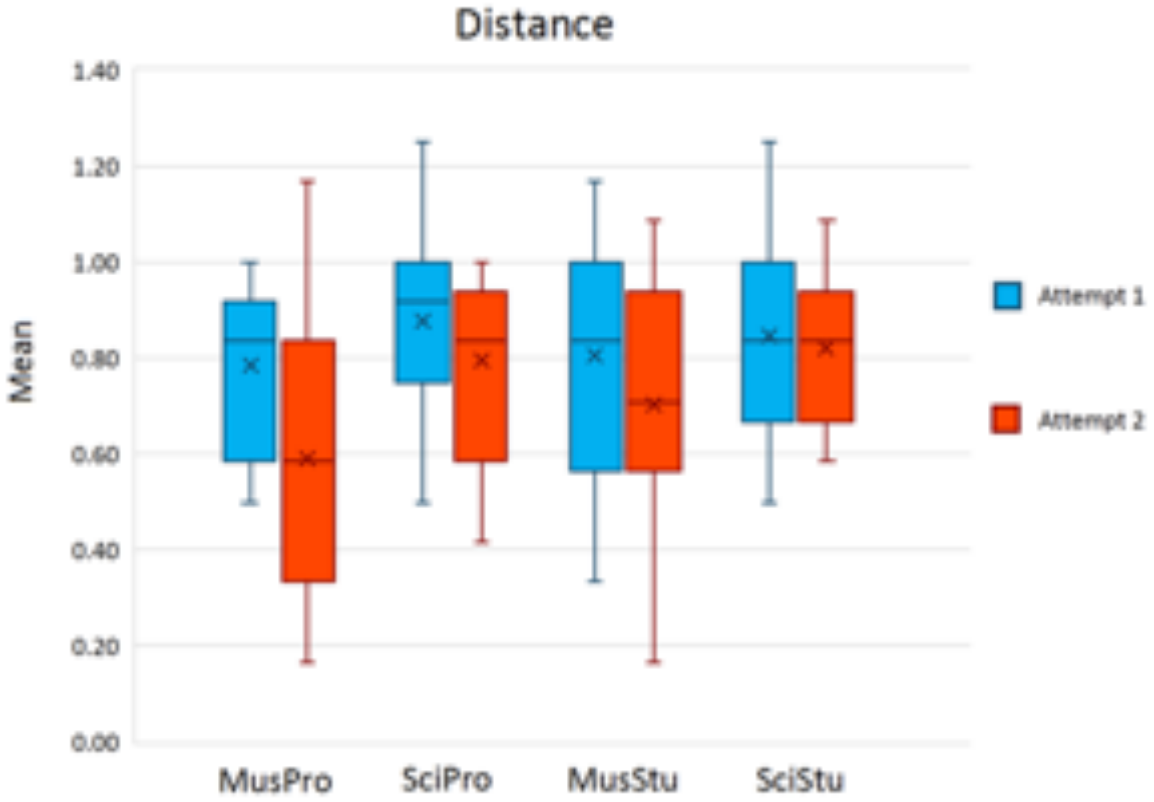
SciPro stands as a signifiatively different group

Results



bimodal distribution !

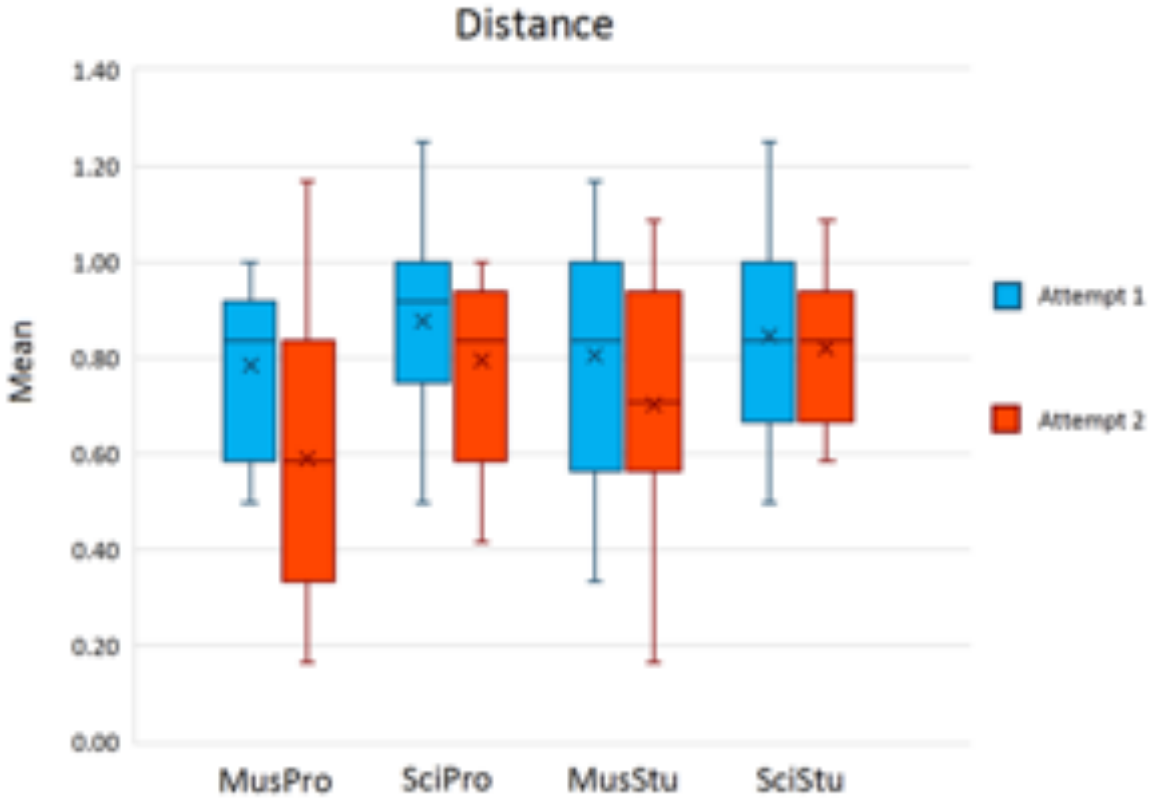
Results



Distance:

$$d = |s_p - s_r|$$

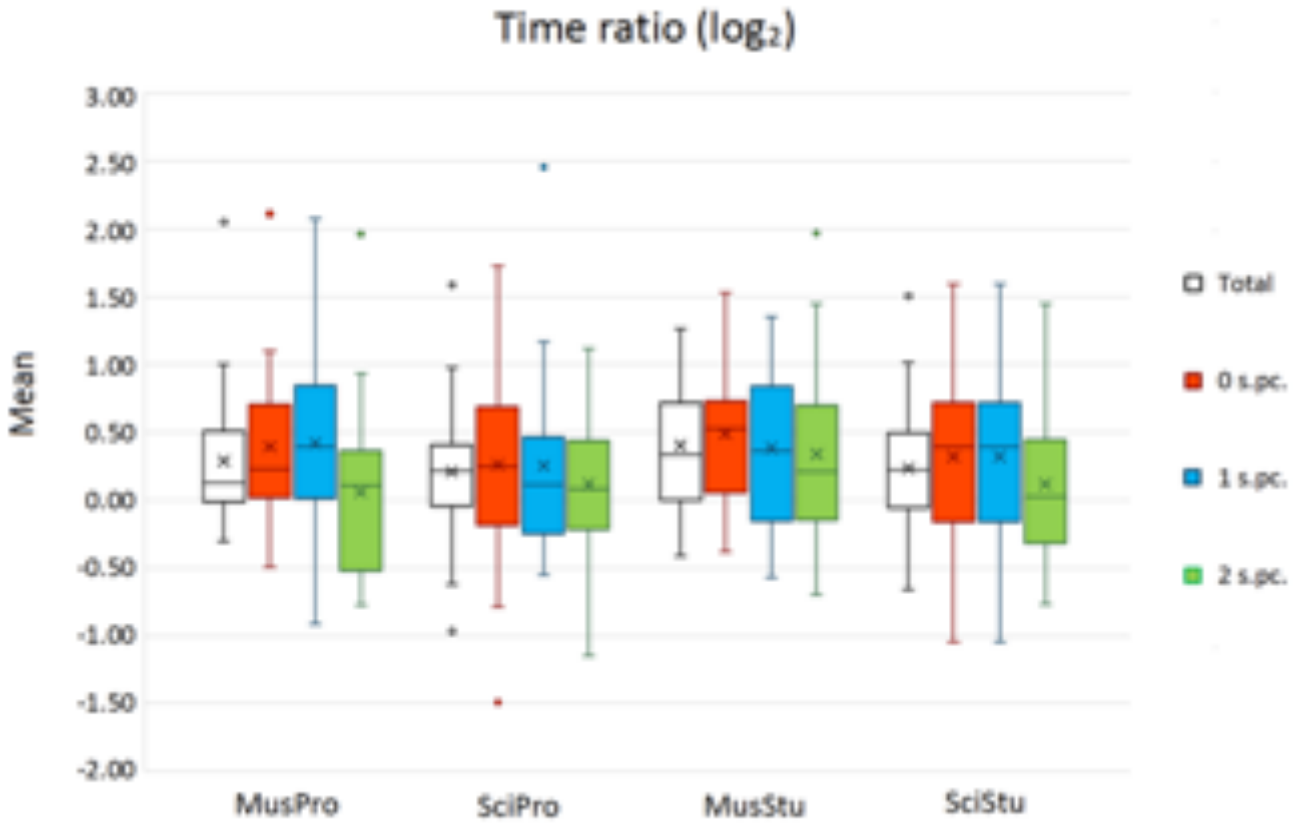
Results



Distance:

MusPro is significantly different for the second attempt when compared with both Sci groups. In addition, MusPro performed significantly different in their second attempt.

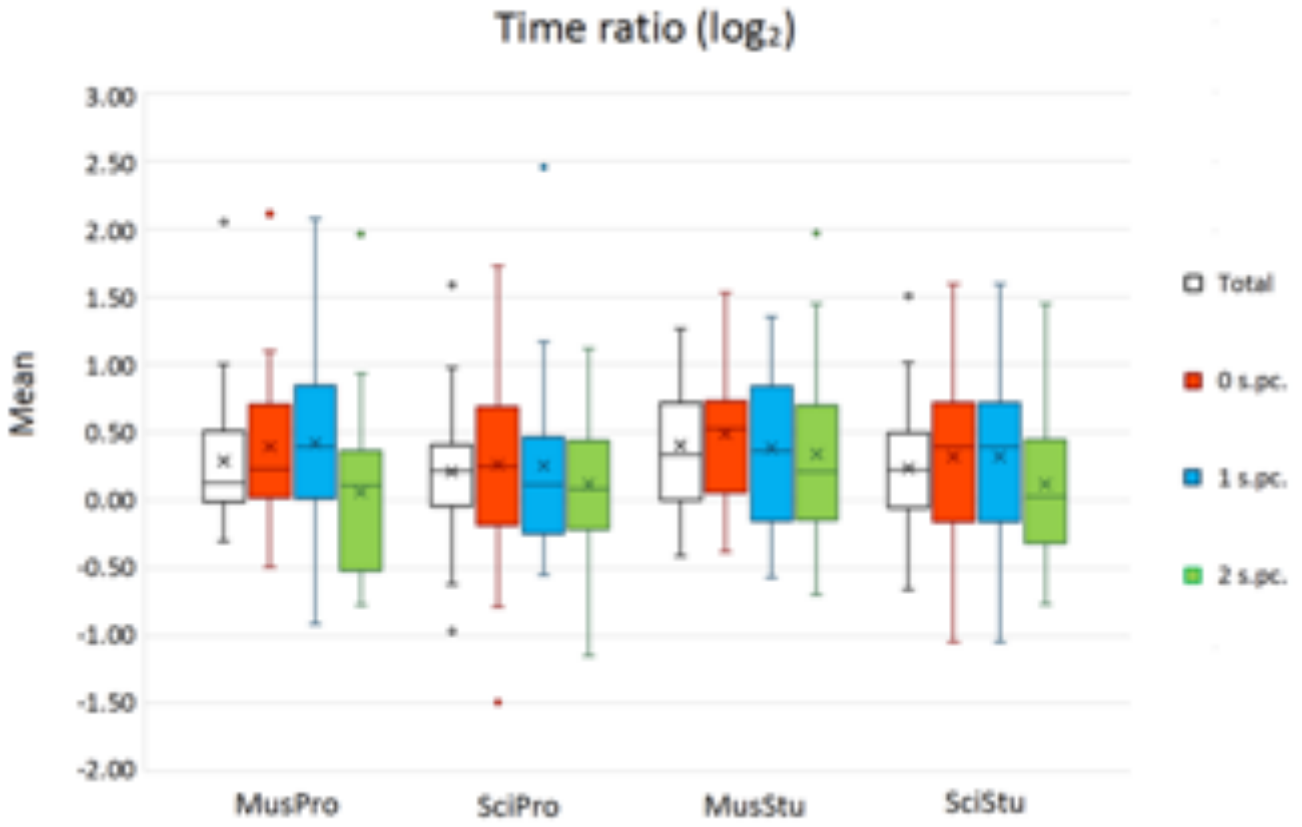
Results



Time ratio:

$$T = \log_2(t_2/t_1)$$

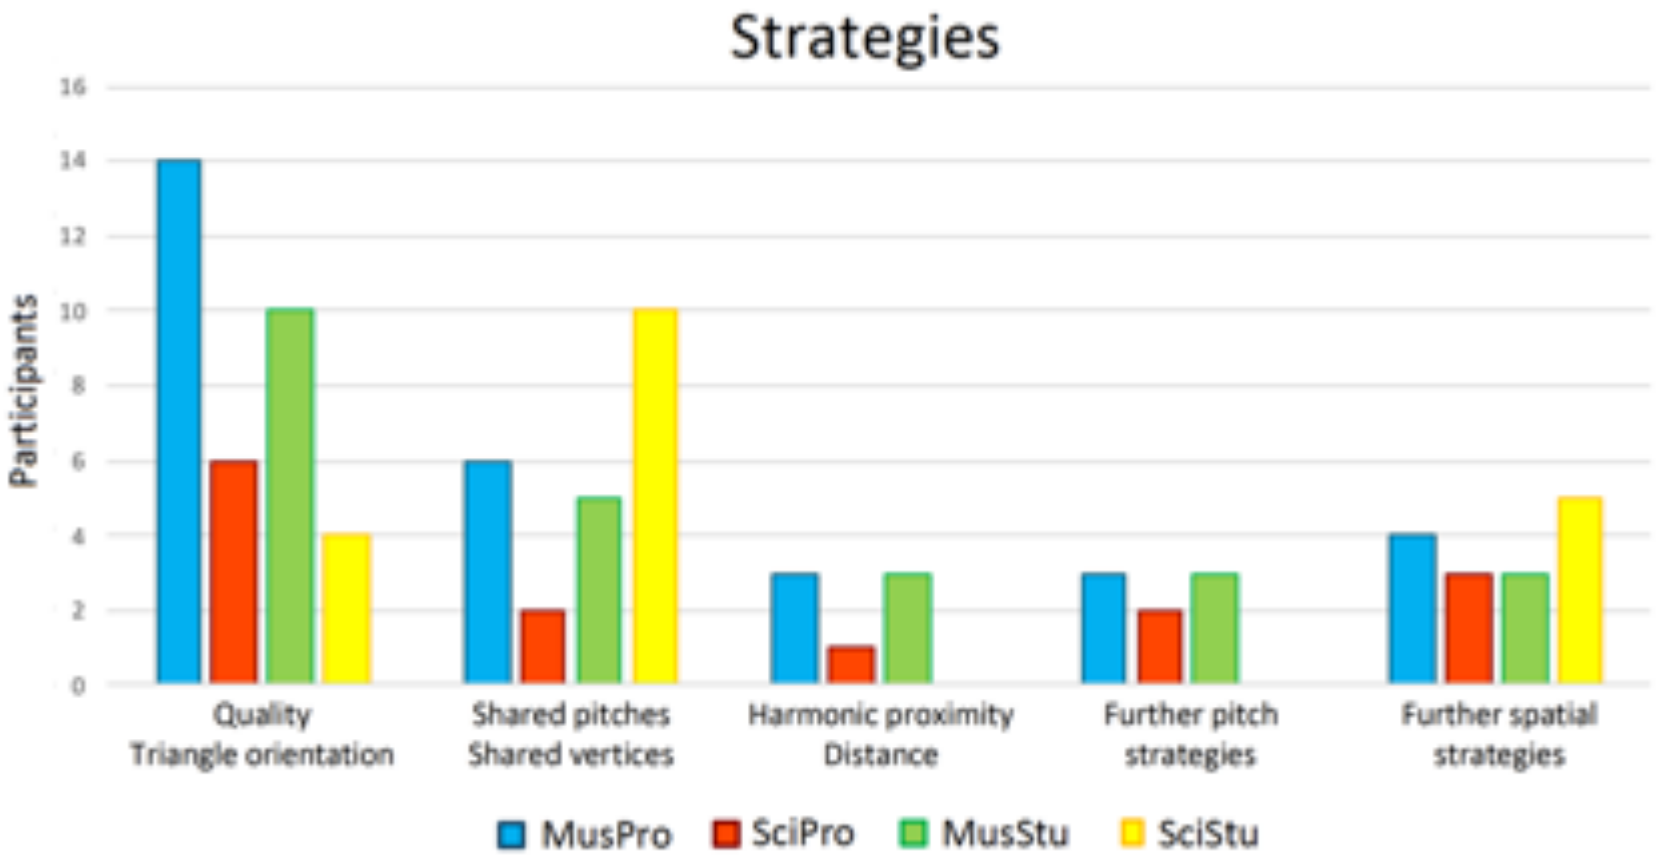
Results



Time ratio:

Positive on average, lower for 2 shared pitch class sets. Particular and significant behavior for MusPro.

Results



One SciPro participant:

"Although I am aware that I am wrong, the only logical answer for me is to follow the alignment of the triangles "

Correlations over |0.30| in italics, variations greater than |0.25| in bold.

Discussion

- Despite the apparent geometrical simplicity of the *Tonnetz*, its deep structural implications are very complex. Only people with high skills in music theory are able, at least, to partially grasp its overall structure at first sight. 

Quality and distance have proven more useful variables for checking this fact than accuracy. However, participants have behaved quite different according to them.

Hypotheses for quality recognition:

MusPro: detection of the feature prior to the video tutorial ?

Sci: Rather intuitive than rationalized

Discussion

- The geometry of the *Tonnetz* is not consistent with the widely spread vertical schema for pitches; nor does it provide self-evident patterned representations of tonal functionality. Both facts may bias the apprehension of the *Tonnetz*, particularly in non-functional harmonic contexts.

Induced visual bias depends on previous skills with music theory and systematic geometrical thinking.

Proximity (in terms of parsimony) related to response time after the video tutorial. Particular behavior of MusPro when tonal functionality and non-functionality clashes.
